HORIZONTAL PIPE SEDIMENT CONTROL

PIPE STOPPER

Pipe Stopper Sediment Control for All Horizontal Pipes

The Pipe Stopper is a horizontal pipe sediment control device designed to prevent or reduce the movement of sediment into stormwater pipes during construction.

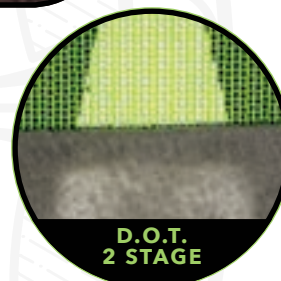

The Pipe Stopper is an HDPE reusable frame that has friction fingers for attachment. The simple installation provides a snug fit that is easily snapped in and out of the pipe opening. The design allows the device to stay in place during the inlet construction, holding back sediment while allowing stormwater to pass through the filter. Each Pipe Stopper has a custom designed filter cover that fits over the HDPE frame, much like a shower cap.

The Pipe Stopper device adds value with the reduced costs associated with pipe clean-outs required prior to final inspections.

STOCK SIZES:

12" / 15" / 18" / 24" / 30"

*Available
Filter Options:*

PSFB-DOT VDOT Approved & PSF-HF
